

Security incident report

Section 1: Identify the network protocol involved in the incident

Hypertext Transfer Protocol (HTTP) which uses port 80 is involved in the incident.

Section 2: Document the incident

The hacker has changed the source code of the website (yummyrecipesforme.com) and added a javascript function that prompts the user to download an executable file and then redirects the user to another website (greatrecipesforme.com). Using tcpdump the logs show that at 14:18:32.192571 the browser initiates a DNS request for the IP address of the yummyrecipesforme.com URL from the DNS server. Then the DNS server replies with the correct IP address. Then the browser initiates an HTTP request to open yummyrecipesforme.com webpage using the IP address sent by the DNS server. Then there is a prompt in the browser to download an executable file (malware). Then the browser initiates a DNS request for another website greatrecipesforme.com. The DNS server responds with the IP address for greatrecipesforme.com. Then the browser initiates an HTTP request to the IP address for greatrecipesforme.com.

Section 3: Recommend one remediation for brute force attacks

Implement password policies in the organization, limit the number of login attempts, use CAPTCHA, use MFA or 2FA, use salting and hashing.
